

FOR IMMEDIATE RELEASE:

Operon Systems Adds Inventory Management to Line of Manufacturing Software Solutions

Greenville, Wis. (March 13, 2012) - Operon Systems today announces the launch of Phoenix, the latest addition to their growing line of workflow management software. The new manufacturing resource planning software (MRP/MES) helps companies simplify and streamline workflow and inventory management.

Phoenix offers ease of installation, flexibility and a top-down view of a company's entire inventory system. The software helps production managers plan purchases of raw materials and component parts to ensure adequate inventory to meet production requirements. Phoenix is easy to use and its web-based functionality allows users to gain access from anywhere.

Troy Dunsirn, President at Operon Systems, said that Operon is dedicated to providing productivity solutions that help their customers run their businesses smoothly and effectively.

"At Operon, we build modern software solutions that help manufacturing companies streamline the workflow from raw materials to final product," said Dunsirn. "Phoenix makes managing inventory and orders simpler and more efficient for our customers."

Phoenix can be used independently or easily integrated with Operon's Manufacturing Suite products RedHawk and Raptor. The three software solutions were designed to perform effectively in the manufacturing environment and are backed by Operon's highly skilled professional services team.

Additional highlights of Phoenix include:

- Order management – The ability to auto-generate work orders.
- Inventory tracking and control – Phoenix supports multiple warehouses and stockrooms with user-defined locations. It provides back flushing of inventory and supports cycle counting and physical inventory.
- Purchasing – The software enables multiple purchasing units of measure, allows multiple bill-to addresses per supplier and remits addresses.
- Shop floor – Work orders and routings are supported, while offering on-line status of work centers, real-time machine status and provides capacity requirements planning.
